

LIFE-SUSTAINING EMERGENCY CARE

A primary concern of the Bangor School Department shall be with the health and safety of its students. In emergency situations involving accident or illness, school employees should undertake reasonable efforts to provide first aid or life-sustaining emergency care to the extent of their knowledge and training, and/or to seek the assistance of school medical personnel or other staff members to obtain emergency assistance for the student.

It is the policy of the Bangor School Department not to comply with directives from parents or others that life-sustaining emergency care should not be provided to any particular student in need of such care while under the control and supervision of the school.

For those students who may present an ongoing need for medical interventions at school, including a need for life-sustaining emergency care, school personnel shall convene a team meeting for the purpose of developing an individualized plan to address the student’s specialized health needs. The team should include persons at the school who are knowledgeable about the student, as well as the student’s parents and a school administrator. The Team may consider requests from the parents that alternative forms of life-sustaining emergency care be used as part of that plan, but those requests must be substantiated by specific medical documentation from the student’s physician. The Team shall not approve a parental request to deny all life-sustaining emergency care for a student, but may specify that only certain types of intervention are appropriate in a particular situation.

For purposes of this policy, “life-sustaining emergency care” means any procedure or intervention applied by appropriately trained school staff that may prevent a student from dying who, without such procedure or intervention, faces a risk of imminent death. Examples of life-sustaining emergency care include (but are not limited to): efforts to stop bleeding, unblocking airways, mouth-to-mouth resuscitation, maintaining an open airway, use of an automated external defibrillator, and cardio-pulmonary resuscitation (“CPR”).
